

Safe Haven Challenge

MARCH 2024

Bob Foreman
Software Engineer Lead
LexisNexis Risk Solutions

RVCE Hack Challenge 2024!

Safe Haven!

Many travelers find themselves on occasion in a strange land and a strange city, sometimes without their control. Without knowing the risks and dangers in that area, sometimes a tourist can suddenly be in a dangerous situation.

What can we do as developers to help prevent this?

This year's challenge will analyze different social factors by area such as poverty, unemployment, and many other factors to assess the risk for the traveler in a strange land.

The goal of the challenge is to answer two questions:

1. Analysis of social factors in an area (unemployment, education, poverty, and population) and identify it as a "Hot Spot".
2. Provide additional information to the traveler to help find “safe haven” resources in their area (fire and police stations, hospitals, churches, food banks, etc.)

The Data!

City and County Data has been collected from all 50 US states and organized into a simple dataset to use as your source. In addition, many public datasets have also been gathered and cleaned to help get you started.

These datasets include:

Education

Unemployment

Poverty

Population

Crime

Police

Fire Stations

Hospitals

Places of Worship

Food Banks

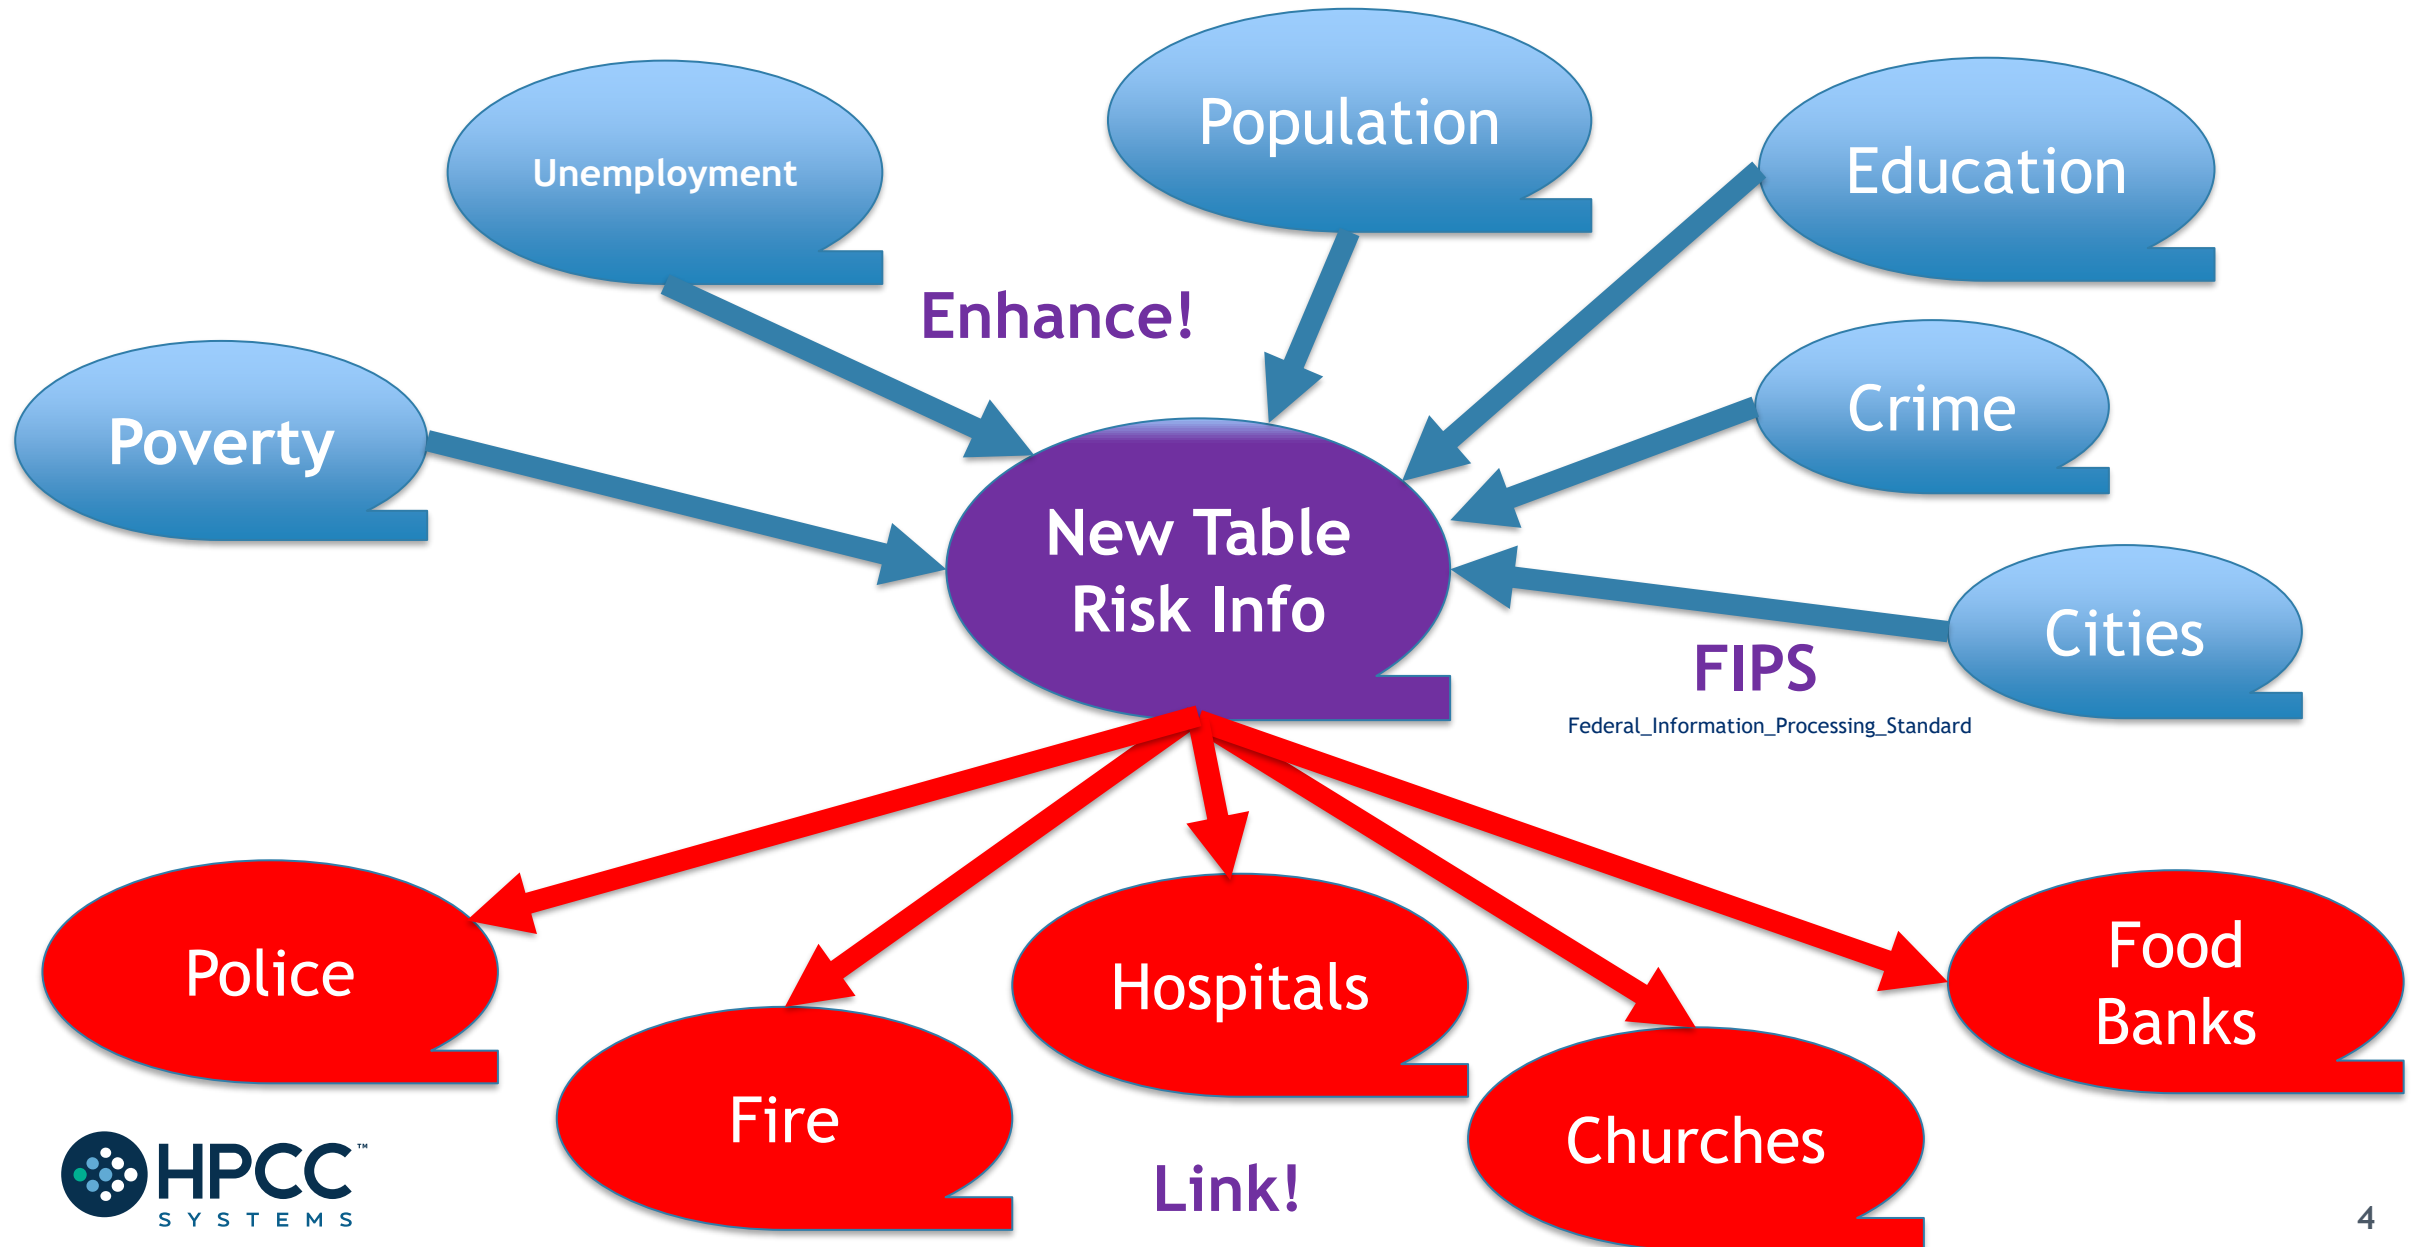

Reference Datasets:

A **Cities** dataset with related FIPS and Zip Codes (used for linking the above datasets to a new “Risk” dataset)

Unemployment Rates (Not really used in this challenge but interesting data!)

You are not limited to using these datasets! Extra credit will be rewarded by linking in other pertinent data!

Data Flow

The Playing Field!

HPCC Cluster ECL Watch:

<http://training.us-hpccsystems-dev.azure.lnrsg.io:8010/>

```
"configurations": [  
  {  
    "name": "External",  
    "type": "ecl",  
    "request": "launch",  
    "protocol": "http",  
    "serverAddress": "training.us-hpccsystems-dev.azure.lnrsg.io",  
    "port": 8010,  
    "path": "",  
    "targetCluster": "thor",  
    "rejectUnauthorized": true,  
    "resultLimit": 100,  
    "timeoutSecs": 60,  
    "user": "YourNameHere",  
    "password": ""  
  },  
]
```

The screenshot shows the 'Preferences' dialog box with the 'Server' tab selected. The 'Configurations' dropdown is set to 'ExternalCluster'. Below it are buttons for 'Locate', 'New...', and 'Delete'. The 'Server IP' field contains 'training.us-hpccsystems-dev.azure.lnrsg.io', with checkboxes for 'SSL' (unchecked) and 'Advanced' (checked). Below this are several server URL fields, all containing the same base URL with different paths: 'Topology Server' (WsTop), 'Workunit Server' (WsWo), 'Attribute Server' (empty), 'Account Server' (Ws_Ac), 'SMC Server' (WsSMC), 'Spray Server' (FileSpr), 'DFU Server' (WsDfu), and 'ECL Watch URL' (esp/fil). At the bottom are 'Ok', 'Cancel', and 'Apply' buttons.

The Repo!

<https://github.com/hpccsystems-solutions-lab/SafeHavenChallenge>

The screenshot displays the GitHub repository page for **SafeHavenChallenge**, which is public. The repository is currently on the **main** branch, with 1 branch and 0 tags. The repository owner is **bobf2000**, and the latest commit is titled "Final Code Update".

The repository structure includes the following files and folders:

- Code** (Folder): Final Code Update
- Images** (Folder): ReadMe and Images up
- LICENSE** (File): Initial commit
- README.md** (File): ReadMe and Images up

The repository is licensed under the **Apache-2.0 license**. The **README** file is highlighted.

On the right side, the **Code** button is circled in red. A red arrow points from this button to the **Download ZIP** button, which is also circled in red. The **Download ZIP** button is located under the **Local** tab, below the **Clone** section.

Examples and Tips

Delivering your Results!

Create a Core Dataset that aggregates your analysis:

```
1  // Let's create a core "risk" file that the county code (FIPS) and the primary city.
2  // We can extra ct this data from the Cities file.
3  IMPORT $;
4  CityDS := $.File_AllData.City_DS;
5  Crime  := $.File_AllData.CrimeDS;
6
7  //CityDS(county_fips = 5035); Test to verify data accuracy for the crime score
8
9
10 // Declare our core RECORD:
11 RiskRec := RECORD
12     STRING45 city;
13     STRING2  state_id;
14     STRING20 state_name;
15     UNSIGNED3 county_fips;
16     STRING30 county_name;
17 END;
18
19 BaseInfo := PROJECT(CityDS,RiskRec);
20 OUTPUT(BaseInfo,NAMED('BaseData'));
21
22 RiskPlusRec := RECORD
23     BaseInfo;
24     EducationScore := 0;
25     PovertyScore   := 0;
26     PopulationScore := 0;
27     CrimeScore     := 0;
28     Total          := 0;
29 END;
30
31 RiskTbl := TABLE(BaseInfo,RiskPlusRec);
32 OUTPUT(RiskTbl,NAMED('BuildTable'));
```

Delivering your Results!

Create a Core Dataset that aggregates your analysis:

```
34 //Let's add a Crime Score!
35
36 CrimeRec := RECORD
37   CrimeRate := TRUNCATE((INTEGER)Crime.crime_rate_per_100000);
38   Crime.fips_st;
39   fips_cty := (INTEGER)Crime.fips_cty;
40   Fips := Crime.fips_st + INTFORMAT(Crime.fips_cty,3,1);
41   END;
42
43 CrimeTbl := TABLE(Crime, CrimeRec);
44 OUTPUT(CrimeTbl, NAMED('BuildCrimeTable'));
45
46 JoinCrime := JOIN(CrimeTbl, RiskTbl,
47   LEFT.fips = (STRING5)RIGHT.county_fips,
48   TRANSFORM(RiskPlusRec,
49     SELF.CrimeScore := LEFT.crimerate,
50     SELF := RIGHT),
51   RIGHT OUTER);
52
53 OUTPUT(SORT(JoinCrime, -CrimeScore), NAMED('AddedCrimeScore'));
54
55 //Now go out and get the others! Good like with your challenge!
56 //After you complete the other scores, make sure to OUTPUT to a file and then create a DATASET so
57 //that you can reference and deliver it to the judges.
58
59
```

Delivering your Results!

Extracting Data using our STRING library:

Submit ▼

Target:

```
1  IMPORT $,STD;
2
3  UNEMP      := $.File_AllData.unemp_byCountyDS;
4  EDU        := $.File_AllData.EducationDS;
5  POVTY      := $.File_AllData.pov_estimatesDS;
6
7
8  //Add Poverty Percentage ages 0-17 for FIPS area:
9  POVTBL := TABLE(POVTY((STD.Str.Find(attribute, 'PCTPOV017_2021',1) <> 0)),
10                  {Fips_Code,attribute,value});
11  OUTPUT(SORT(POVTBL,-value),NAMED('PovertyPct0to17'));
12
13  //Add Unemployment Rate for area:
14  CT_UNEMP := TABLE(UNEMP((STD.Str.Find(attribute, 'Unemployment_rate',1) <> 0)),
15                  {Fips_Code,cnt := ROUND(AVE(GROUP,value),2)},Fips_Code);
16  OUTPUT(SORT(CT_UNEMP,-cnt),NAMED('UNEMP_Rate'));
17
18  EDU_CT_FIPS := TABLE(EDU((STD.Str.Find(attribute, 'Percent of adults with less than a high school diploma',1) <> 0)),
19                  {Fips_Code,tot := ROUND(AVE(GROUP,value),2)},fips_code);
20  OUTPUT(SORT(EDU_CT_FIPS,-tot),NAMED('NoHighSch'));
21
```

Data Delivery (Roxie and Visualization)

Delivering your Results!

Step 1 - Clean, Declare and Build your Indexes (Churches):

```
1  IMPORT $,STD;
2  //This file is used to demonstrate how to "clean" a raw dataset (Churches) and create an index to be used in a ROXIE service
3  Churches := $.File_AllData.ChurchDS;
4  Cities   := $.File_AllData.City_DS;
5
6
7  //First, determine what fields you want to clean:
8  CleanChurchRec := RECORD
9      STRING70 name;
10     STRING35 street;
11     STRING22 city;
12     STRING2  state;
13     UNSIGNED3 zip;
14     UNSIGNED1 affiliation;
15     UNSIGNED3 PrimaryFIPS; //New - will be added from Cities DS
16 END;
17 //PROJECT is used to transform one data record to another.
18 CleanChurch := PROJECT Churches, TRANSFORM(CleanChurchRec,
19     SELF.name           := STD.STR.ToUpperCase(LEFT.name),
20     SELF.street         := STD.STR.ToUpperCase(LEFT.street),
21     SELF.city           := STD.STR.ToUpperCase(LEFT.city),
22     SELF.State          := STD.STR.ToUpperCase(LEFT.state),
23     SELF.zip            := LEFT.zip,
24     SELF.affiliation     := LEFT.affiliation,
25     SELF.PrimaryFIPS    := 0));
```

Delivering your Results!

Step 1 - Clean, Declare and Build your Indexes (Churches):

```
26 //JOIN is used to combine data from different datasets
27 CleanChurchFIPS := JOIN(CleanChurch,Cities,
28     LEFT.city = STD.STR.ToUpperCase(RIGHT.city) AND
29     LEFT.state = RIGHT.state_id,
30     TRANSFORM(CleanChurchRec,
31         SELF.PrimaryFIPS := (UNSIGNED3)RIGHT.county_fips,
32         SELF := LEFT),LEFT OUTER,LOOKUP);
33 //Write out the new file and then define it using DATASET
34 WriteChurches := OUTPUT(CleanChurchFIPS,, '~SAFE::OUT::Churches',OVERWRITE);
35 CleanChurchesDS := DATASET('~SAFE::OUT::Churches',CleanChurchRec,FLAT);
36
37 //Declare and Build Indexes (special datasets that can be used in the ROXIE data delivery cluster
38 CleanChurchIDX := INDEX(CleanChurchesDS,{city,state},{CleanChurchesDS}, '~SAFE::IDX::Church::CityPay');
39 CleanChurchFIPSIDX := INDEX(CleanChurchesDS,{PrimaryFIPS},{CleanChurchesDS}, '~SAFE::IDX::Church::FIPSPay');
40 BuildChurchIDX := BUILD(CleanChurchIDX,OVERWRITE);
41 BuildChurchFIPSIDX := BUILD(CleanChurchFIPSIDX,OVERWRITE);
42
43 //SEQUENTIAL is similar to OUTPUT, but executes the actions in sequence instead of the default parallel actions of the HPCC
44 SEQUENTIAL(WriteChurches,BuildChurchIDX,BuildChurchFIPSIDX);
45
```

Delivering your Results!

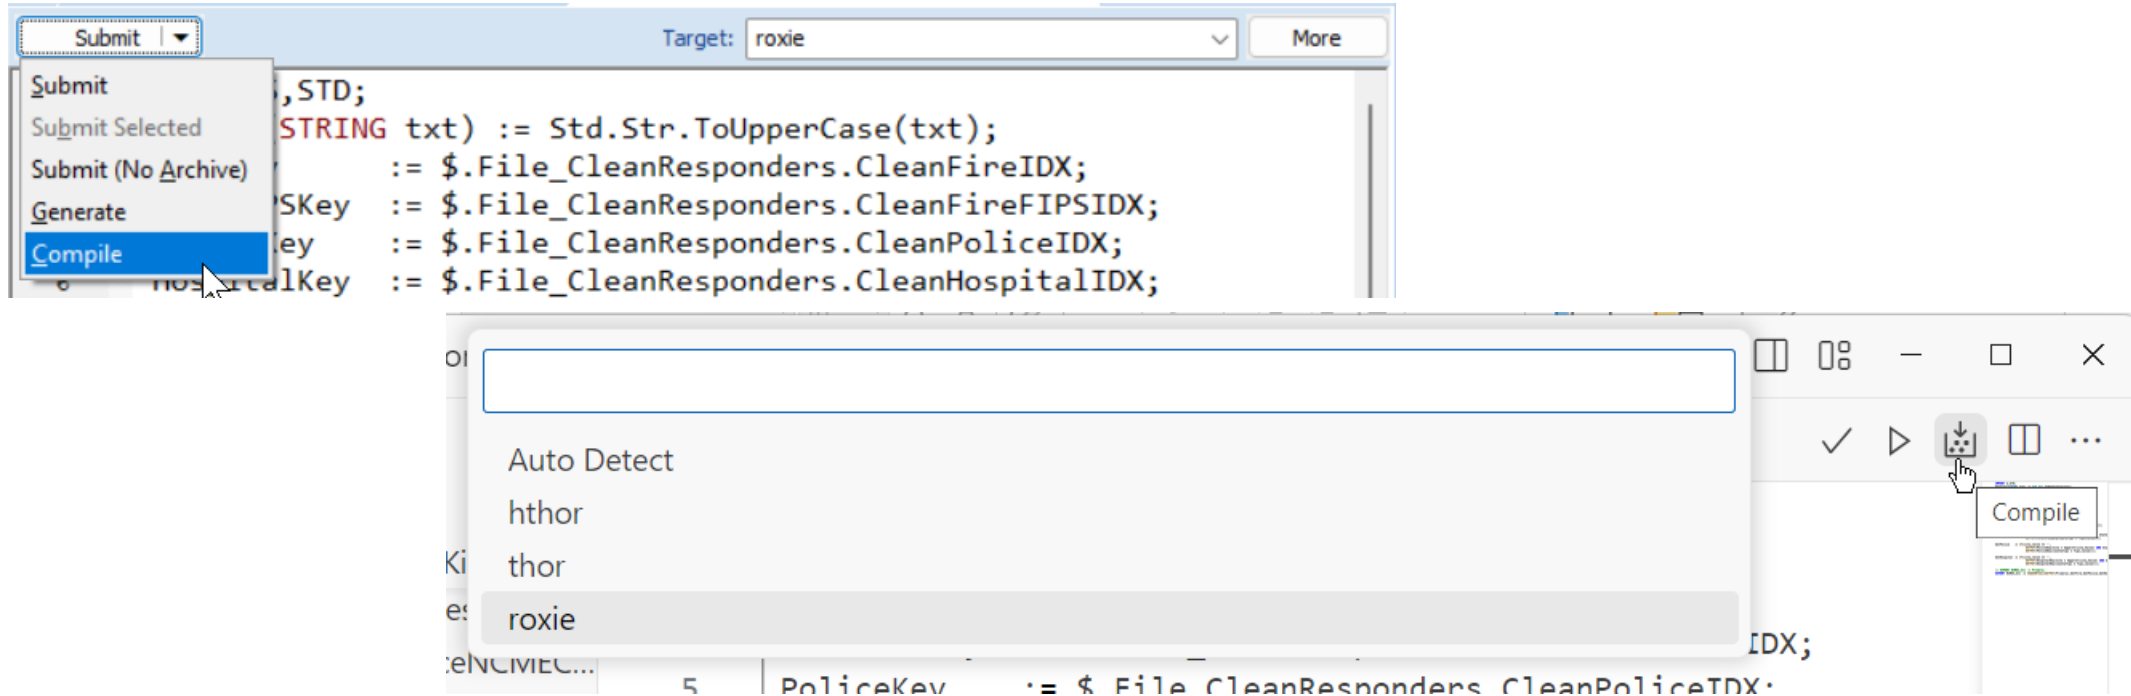

Step 2 - Design and Write Your Query:

```
1  IMPORT $,STD;
2  UpperIt(STRING txt) := Std.Str.ToUpperCase(txt);
3  //These INDEXes are created (built) in BWR_CleanChurches
4  CleanChurchRec := RECORD
5      STRING70 name;
6      STRING35 street;
7      STRING22 city;
8      STRING2 state;
9      UNSIGNED3 zip;
10     UNSIGNED1 affiliation;
11     UNSIGNED3 PrimaryFIPS; //New - will be added from Cities DS
12 END;
13 CleanChurchesDS := DATASET('~SAFE::OUT::Churches',CleanChurchRec,FLAT);
14 CleanChurchIDX := INDEX(CleanChurchesDS,{city,state},{CleanChurchesDS},'~SAFE::IDX::Church::CityPay');
15 CleanChurchFIPSIDX := INDEX(CleanChurchesDS,{PrimaryFIPS},{CleanChurchesDS},'~SAFE::IDX::Church::FIPSPay');
16
17 /* To Publish your Query:
18 1. Change Target to ROXIE
19 2. Compile ONLY
20 3. Open ECL Watch and select the Publish tab to publish your query
21 4. Test and demonstarte using: http://training.us-hpccsystems-dev.azure.lnrsg.io:8002
22
23 */
24 EXPORT Safe_Svc(FipsVal,STRING22 CityVal,STRING2 StateVal) := FUNCTION
25 MyChurch := IF(FipsVal = 0,
26     OUTPUT(CleanChurchIDX(City=UpperIt(CityVal),State=UpperIt(StateVal))),
27     OUTPUT(CleanChurchFIPSIDX(PrimaryFIPS=FipsVal)));
28 RETURN MyChurch;
29 END;
30
```

Step 3 - Deploy(Publish) and then Test Your Query:

The screenshot shows the HPCC Systems web interface in a browser. The address bar displays the URL `training.us-hpccsystems-dev.azure.lnrsg.io:8002`, with a red arrow pointing to it. The browser's bookmark bar includes 'Corporate Bookmarks', 'System Dashboard...', 'Home Page | HPCC...', 'ECL Watch Training 2', 'ECL Watch | 160', and 'Eventbrite'. The HPCC Systems header includes 'View', 'Frame', and 'Log Out' links. Below the header, there are tabs for 'Form' and 'Links'. The left sidebar, titled 'Active Queries', shows a tree structure under 'Targets' with 'hthor' expanded, containing 'demo.safe_svc' (highlighted with a red arrow), 'thor', 'roxie', and 'thor_roxie'. The main content area displays the 'hthor' target configuration for 'demo.safe_svc', with a 'Dynamic Form' dropdown. Below this, the 'DEMO_SAFE_SVCREQUEST' section contains three input fields: 'cityval:', 'fipsval:', and 'stateval:'. A red arrow points to the 'Submit' button at the bottom of the form. The bottom of the interface shows 'Output Tables' and 'FORM POST' dropdowns, and 'Submit' and 'Clear All' buttons.

Alternate Delivery: Visualization

HPCC Systems provides built-in Visualization of your output data in a variety of charts and graphs. You can visualize your data in three ways:

- Using the Chart Tool in the ECL Playground.
- Accessing the Visualize tab in all ECL workunits
- Using the Resources tab in conjunction with the ECL Visualizer bundle.

Installing:

ecl bundle install <https://github.com/hpcc-systems/Visualizer.git>

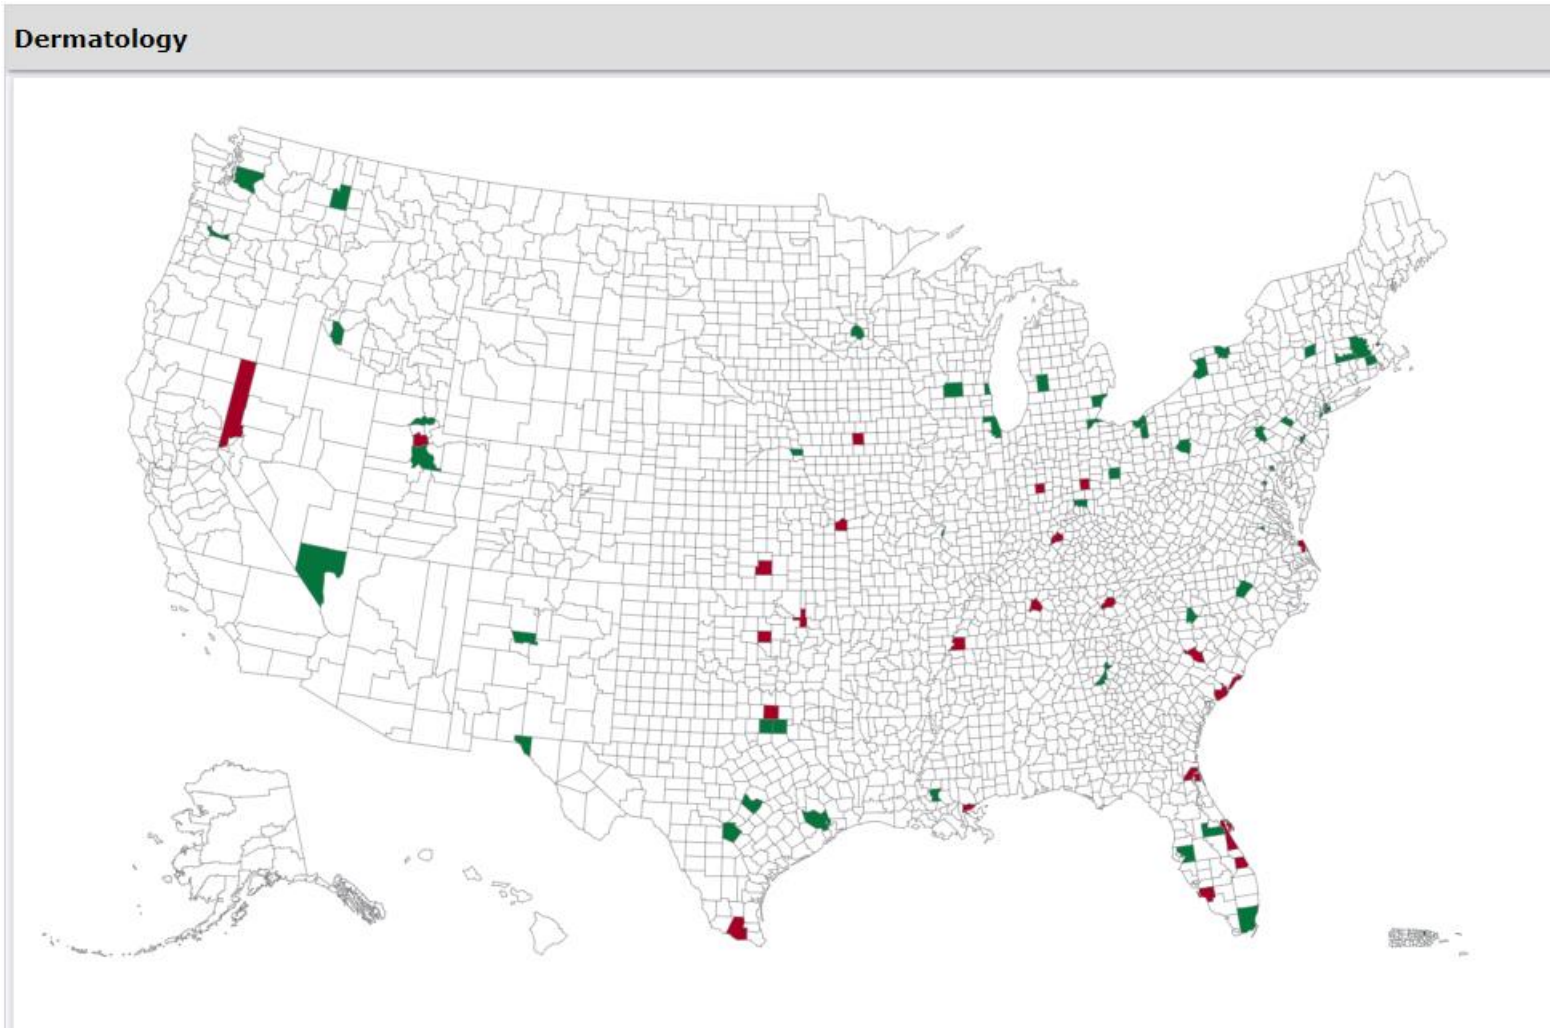

<https://hpccsystems.com/resources/visualizing-ecl-and-sharing-your-results-the-hpcc-systems-visualizer/>

<https://github.com/hpcc-systems/Visualizer>

Visualization Examples:

```
1  IMPORT $,Visualizer;  
2  
3  Cities := $.File_AllData.City_DS;  
4  
5  //Build Table  
6  DensityTbl := TABLE(Cities,{(INTEGER)county_fips,(INTEGER)density});  
7  
8  OUTPUT(DensityTbl,NAMED('DenFIPS'));  
9  
10 Visualizer.Choropleth.USCounties('Fips_demo',,'DenFIPS', , , DATASET(['paletteID', 'Default;t']), Visualizer.KeyValueDef));  
11  
12
```

Visualization Examples:

Final Thoughts

- ✓ Since your solution is the key part to this challenge you can use `#OPTION('obfuscateOutput', TRUE);` at the start of your code to hide it from being viewed on ECL Watchpage. If you decide to use `#OPTION` make sure to remove it from the WUID that you shared with the judges. When `obfuscateOutput` set to true, details are removed from the generated workunit, including ECL code, estimates of record size, and number of records.
- ✓ If you want to write the result to a file, make sure the file name starts with your team's name for uniqueness purpose.
- ✓ Make sure the query names are unique and easy to identify. Do not use generic names like test, mentors, or roxie. We suggest adding your team's name as well. General names will result in other teams overwriting your files, queries, and results
- ✓ We encourage team play so teams that help answer questions in Slack will be considered favorably in judging.
- ✓ Direct emails and direct messages to judges asking for support will be *ignored* and it won't work in team's favor
- ✓ We also encourage students to leverage our community forum and/or StackOverflow for ECL coding related questions. Please make sure to tag your questions with *hpcc-ecl*.
